

IN THE SPECIFICATION

Please amend the specification as follows:

Replace paragraph [0050] at page 12, with the following replacement paragraph:

---[0050] In the example source control system, there is a restricted signing state for each qualification state. If a restricted signing state requires an electronic signature and the state to which a transition is being made also requires an electronic signature, then the two signatures need to be different. A user may specify that a state does not require a restricted signing state. This embodies the Good Automated Manufacturing Practice (GAMP) "Four Eyes" principle. For more information, see "The Good Automated Manufacturing Practice (GAMP) Guide for Validation of Automated Systems in Pharmaceutical Manufacture," available from The Society for Life Science Professionals (<http://www.ispe.org>). Changing the qualification state of an object version does not change the version number. A default installation of the source control system includes a database with a single qualification state named "implemented" with an attribute set to allow loading to a controller and a fallback state set to "implemented".---
